

TELEHANDLERS

Telehandlers combine the load lifting capabilities of a forklift with a crane's lifting range. A strong yet light telescopic boom is the key to its versatility, bringing more power, reach and flexibility to the work site.

Since the telescopic boom on a telehandler extends while carrying a load, it acts as a lever and can cause the telehandler to become unstable. Since the dead weight of the boom is essential to maintaining the structure's overall stability, the strength-to-weight ratio is critical.

With its high strength-to-weight ratio, Strenx® steel can help your telehandlers handle nearly anything. Get maximum lift capacity, lift height and reach while maintaining the strength, stability and safety of your telehandler.
